Secured by Design accredited aluminium communal doors

revA

Constructed from reinforced aluminium and stainless steel, the Classic^{AL} combines superior strength and vandal resistance, with a sleek, contemporary appearance.

Using lightweight, robust materials means the Classic^{AL} communal entrance door is far easier to install, and can weigh up to 60% less than a similar door manufactured from steel.

The Classic^{AL} is available with a variety of locking options, including Secured by Design approved high quality maglocks with integral surge protection, and panic escape push bars.

Classic^{AL} communal entrance doors are made to measure, and offered in a wide range of single and double door configurations, with optional side, overhead or standalone panels.

The Classic^{AL} is supplied in a high quality polyester powder coating, in a choice of 9 colours with a textured finish, as standard. Other colours and finishes are available on request.

Due to its inventive design, the Classic^{AL} is precision engineered to be manufactured in Newton's shortest lead time, with nationwide delivery and installation services available.

DOOR & PANEL CONFIGURATIONS

Please note, the configurations are shown with glazing panels, but any of these may be replaced with solid infill. 6mm or 10mm laminate, polycarbonate or double glazing is available in our Classic^{AL} design. Alternative designs are available with the Classic2 steel communal doors and Classic2^S stainless steel doors.

WARRANTIES & ACCREDITATIONS

Supplied with a 10 year anti-rust warranty, Classic^{AL} not only provides enhanced corrosion resistance, it is also the most cost-effective and economic choice.

Requiring low maintenance, and providing long life reliability, the Classic^{AL} comes with a 1 year manufacturer's warranty on hardware, and a 5 year fabrication warranty.

Designed to meet rigorous requirements, Classic^{AL} communal entrance doors are Secured by Design accredited, and LPCB certified to LPS 2081 Security Rating B.

The Classic^{AL} achieved Secured by Design status by demonstrating its effectiveness in preventing or reducing crime, through passing standards and tests nominated by the police service.

Confirming that products meet a certain criteria, and providing a certified standard of security, LPS 2081 evaluates the resistance of physical security products when targeted by intruders using stealth.

To achieve Security Rating B, Classic^{AL} successfully passed third-party testing which simulates an opportunistic attack using tools such as a bolt cutter, and pipe wrench.
